

The operational infrastructure of fulfillment centers is contributing to associate burnout, physical strain, and employee turnover.

1. Why are associates experiencing burnout and physical strain?

- Employees frequently feel unsupported, overworked, and overlooked

2. Why do employees feel unsupported, overworked, and overlooked?

- Employees often experience long shifts, physically demanding workloads, limited effective break time, and communication gaps with management.

3. Why are communication gaps and operational strain occurring within the AFCs?

- Management and operational teams may be heavily focused on maintaining productivity, staffing coverage, and workflow demands, making it difficult to consistently support associates at an individual level.

4. Why might management struggle to consistently support associates?

- Managers themselves may be experiencing operational pressure, high workloads, limited preparation, or insufficient support while trying to balance productivity expectations with employee needs.

5. Why are productivity expectations and operational demands outweighing employee support and recovery?

- Because the fulfillment center system appears to be designed primarily around maintaining speed, output, and operational efficiency, while workforce sustainability and recovery are treated as secondary concerns rather than built directly into the operational structure.
